

Travertine

WARCO tiles in a classic and light colour called Travertine are produced in 100% of **black, and subtle beige EPDM rubber granulate**. EPDM (Ethylen-Propylen-Dien-Kautschuk) is a weatherproof, UV-resistant and a particularly robust type of rubber which makes a perfect choice in all the places where a **durable and colour-fast product is needed**. The natural Travertine shade makes an incredibly light (but not cold), noble component ideal for both modern and classic interior.

Wide range of colours

Produced of top quality material EPDM, modern WARCO balcony and terrace tiles are now available in **14 attractive colours!** Discover our wide selection of tints ranging from those vivid and distinct ones, such as Etna, Parrot, Atlantic or Lavender, throughout light, noble shades, like Travertine. See also those which are pure classics — just like the elegant Deep Black, Dark-, Classic- and Light Granite, English Lawn, or Caffè latte. Thanks to our wide choice of colours you will find a **matching design to every interior**.

EPDM material

Coloured rubber granulate called EPDM (Ethylene Propylene Diene Monomer) is an **impressively durable material**, which makes a stylish, colour-fast and a long-lasting **terrace and balcony flooring**. EPDM tiles are **resistant to all weather conditions**, including UV rays, humidity (rain), frost, heat and cold. Thoroughly coloured EPDM granulate retains its colour intensity and saturation, even in abrasive use. What is of large importance, is that EPDM tiles are **pleasantly comfortable**, as they ensure acoustic and thermal insulation. Ultimately, they create a heavy duty and top quality flooring.

Smart connection systems

Thanks to our ingenious connection systems, the **installation** of WARCO tiles becomes **child's play**. The flooring has to

be installed on an even subfloor and joined throughout two types of a form-fit connection:

In the tongue and groove system, the tile's sides have got a profiled tongue and a matching groove element. The tiles are **assembled through connecting the tongue** of one tile **with the groove** of another one, thus obtaining a steady surface without open joints.

safety tiles - terrace tiles

In case of the **interlocking zip system**, there are **three-dimensional 'teeth'** profiled on the tile's sides. They connect with each other, fixing the tiles in their correct position, creating a safe and stable flooring without edging and gluing (also secured against shifting).
